

Summary:

Influenza (flu) is a contagious respiratory illness caused by Influenza viruses. It can cause mild to severe illness with serious outcomes like hospitalizations or death. Susceptible individuals can be young children, older adults and people who have underlying serious health issues. The following report displays information about the hospitalizations due to influenza and emergency room (ER) and Urgent Care (UC) visits for *influenza-like illness (ILI) with fever* by Lake County residents for the current flu season, and compared with averages for the past five flu seasons.

The Dashboard (Page 2) illustrates the weekly flu activity including the reported hospitalizations for seasonal flu as reported in the Ohio Disease Reporting System (ODRS) and those with fever and ILI reporting to ERs and UCs from Epi Center, Ohio's syndromic surveillance system (<https://www.health-monitoring.com>). Public Health surveillance data indicate *low-medium flu activity* in Lake County/Ohio (www.flustar.com/) in the current week.

The data for this report was extracted on 05/19/2022 from Ohio Disease Reporting System and Epi Center and can subject to change as additional data is reported.

Data Sources:

1. Emergency Department Visits (Epi Center): Epicenter collects emergency department chief complaint data from hospitals and urgent care facilities visited by Lake County residents and classifies them into symptom and syndrome categories. Chief complaints regarding fever, ILI and other symptoms commonly detected during flu season are analyzed.

2. Influenza- Associated Hospitalizations (ODRS): For seasonal flu, influenza-associated hospitalizations and pediatric deaths are reported by LCGHD and hospitals using the Ohio Disease Reporting system (ODRS). Individual cases of influenza are only reported if a novel strain is detected. Hospitalizations are considered as the indicator for the severity of illness during particular influenza season.
